training temperature was below 5 °C in November–March, thus increasing risk, whereas the relative humidity was mostly above 60 %, thus decreasing risk. All in all, to better know how to improve the level of safety in the inflatable football arenas in regard to COVID-19 infection as well as the overall breathable air risks, we conclude that there is an urgent need for more measurements and research.

Acknowledgements: Funding from the Academy of Finland, Flagship (grant no. 337552) is gratefully acknowledged. Collaboration with the football clubs and their representatives, MPS (Malmin Palloseura) Jukka Airaksinen and JäPS (Järvenpään Palloseura) Jari Kurittu and Marika Hagelin, are acknowledged for inviting science to meet practice. Tero Auvinen from Finnish Football Association and Mihaly Szerovay (University of Jyväskylä) are acknowledged for boosting collaboration.
